Proof of Regularity of 1-, 2-, and 3-Sums of Matroids

Ivan Sergeev

March- 2025

Preliminaries 1

1.1 Total Unimodularity and Partial Unimodularity

Definition 1. We say that a matrix A is totally unimodular, or TU for short, if for every $k \in \mathbb{Z}_{>1}$, every $k \times k$ submatrix T of A has det $T \in \{0, \pm 1\}$.

Definition 2. Given $k \in \mathbb{Z}_{\geq 1}$, we say that a matrix A is k-partially unimodular, or k-PU for short, if every $k \times k$ submatrix T of A has $\det T \in \{0, \pm 1\}$.

Lemma 3. A matrix A is TU if and only if A is k-PU for every $k \in \mathbb{Z}_{>1}$.

Proof. This follows from Definitions 1 and 2.

1.2 Pivoting

1.2.1**Definitions**

long tableau pivot, short tableau pivot

1.2.2 Properties

Lemma 4. Let $B = \begin{bmatrix} B_{11} & 0 \\ B_{21} & B_{22} \end{bmatrix} \in \mathbb{Q}^{\{X_1 \cup X_2\} \times \{Y_1 \times Y_2\}}$. Let $B' = \begin{bmatrix} B'_{11} & B'_{12} \\ B'_{21} & B'_{22} \end{bmatrix}$ be the result of performing a short tableau pivot on $(x, y) \in X_1 \times Y_1$ in B. Then $B'_{12} = 0$, $B'_{22} = B_{22}$, and $\boxed{B'_{11} \\ B'_{21} \end{bmatrix}$ is the matrix resulting from performing a short tableau pivot on (x, y) in $\begin{bmatrix} B_{11} \\ B_{21} \end{bmatrix}$.

Proof. This follows by a direct calculation. Indeed, because of the 0 block in B, B_{12} and B_{22} remain unchanged, and since B_{11} is a submatrix of B containing the pivot element, performing a short tableau pivot in it is equivalent to performing a short tableau pivot in B and then taking the corresponding submatrix. \Box

Lemma 5. Let $k \in \mathbb{Z}_{\geq 1}$, let $A \in \mathbb{Q}^{k \times k}$, and let A' be the result of performing a short tableau pivot in Aon $A(x,y) \neq 0$ where $x,y \in \{1,\ldots,k\}$. Then A' contains a submatrix A'' of size $(k-1) \times (k-1)$ with $|\det A''| = |\det A|/|A(x,y)|.$

Proof. Let $X = \{1, \ldots, k\} \setminus \{x\}$ and $Y = \{1, \ldots, k\} \setminus \{y\}$, and let A'' = A'(X, Y). Since A'' does not contain the pivot row or the pivot column, $\forall (i,j) \in X \times Y$ we have $A''(i,j) = A(i,j) - \frac{A(i,y) \cdot A(x,j)}{A(x,y)}$. For $\forall j \in Y$, let B_i be the matrix obtained from A by removing row x and column j, and let B_i'' be the matrix obtained from A" by replacing column j with A(X,y) (i.e., the pivot column without the pivot element). The cofactor expansion along row x in A yields

$$\det A = \sum_{j=1}^{k} (-1)^{y+j} \cdot A(x,j) \cdot \det B_j.$$

By reordering columns of every B_i to match their order in B_i'' , we get

$$\det A = (-1)^{x+y} \cdot \left(A(x,y) \cdot \det A' - \sum_{j \in Y} A(x,j) \cdot \det B''_j \right).$$

By linearity of the determinant applied to $\det A''$, we have

$$\det A'' = \det A' - \sum_{j \in Y} \frac{A(x,j)}{A(x,y)} \cdot \det B''_j$$

Therefore, $|\det A''| = |\det A|/|A(x,y)|$.

Lemma 6. Let $k \in \mathbb{Z}_{\geq 1}$, let $A \in \mathbb{Q}^{k \times k}$, and let A' be the result of performing a short tableau pivot in A on $A(x,y) \in \{\pm 1\}$ where $x,y \in \{1,\ldots,k\}$. Then A' contains a submatrix A'' of size $(k-1) \times (k-1)$ with $|\det A''| = |\det A|$.

Proof. Apply Lemma 5 to A and use that $A(x,y) \in \{\pm 1\}$.

1.3 Vector Matroids

1.3.1 Full Matrix Representation

definition, properties

1.3.2 Standard Matrix Representation

definition, properties

1.3.3 Conversion From Full to Standard Matrix Representation

match lean implementation

Lemma 7. Let M be a matroid represented by a matrix $A \in \mathbb{Q}^{X \times Y}$ and let B be a base of M. Then there exists a matrix $S \in \mathbb{Q}^{B \times (Y \setminus B)}$ that is a standard representation matrix of M.

Proof. Let $C = \{A(\bullet, b) \mid b \in B\}$. Since B is a base of M, we can show that C is a basis in the column space span $\{A(\bullet, y) \mid y \in Y\}$. For every $y \in Y \setminus B$, let $S(\bullet, y)$ be the coordinates of $A(\bullet, y)$ in basis C. We can show that $[I \mid S]$ represents the same matroid as A, so S is a standard representation matrix of M.

Lemma 8. Let M be a matroid represented by a TU matrix $A \in \mathbb{Q}^{X \times Y}$ and let B be a base of M. Then there exists a matrix $S \in \mathbb{Q}^{B \times (Y \setminus B)}$ such that S is TU and S is a standard representation matrix of M.

Proof sketch. Apply the procedure described in the proof of Lemma 7 to A. This procedure can be represented as a sequence of elementary row operations, all of which preserve TUness. Dropping the identity matrix at the end also preserves TUness.

write up new proof using general pivoting

1.3.4 Support Matrices

Definition 9. Let F be a field. The support of matrix $A \in F^{X \times Y}$ is $A^{\#} \in \{0,1\}^{X \times Y}$ given by

$$\forall i \in X, \ \forall j \in Y, \ A^{\#}(i,j) = \begin{cases} 0, & \text{if } A(i,j) = 0, \\ 1, & \text{if } A(i,j) \neq 0. \end{cases}$$

see details in implementation

П

Definition 10. Let M be a matroid, let B be a base of M, and let $e \in E \setminus B$ be an element. The fundamental circuit C(e, B) of e with respect to B is the unique circuit contained in $B \cup \{e\}$.

Lemma 11. Let M be a matroid and let $S \in F^{X \times Y}$ be a standard representation matrix of M over a field F. Then $\forall y \in Y$, the fundamental circuit of y w.r.t. X is $C(y,X) = \{y\} \cup \{x \in X \mid S(x,y) \neq 0\}$.

Proof. Let $y \in Y$. Our goal is to show that $C'(y, X) = \{y\} \cup \{x \in X \mid D(x, y) \neq 0\}$ is a fundamental circuit of y with respect to X.

- $C'(y, X) \subseteq X \cup \{y\}$ by construction.
- C'(y,X) is dependent, since columns of $[I \mid S]$ indexed by elements of C(y,X) are linearly dependent.
- If $C \subsetneq C'(y, X)$, then C is independent. To show this, let V be the set of columns of $[I \mid S]$ indexed by elements of C and consider two cases.
 - 1. Suppose that $y \notin C$. Then vectors in V are linearly independent (as columns of I). Thus, C is independent.
 - 2. Suppose $\exists x \in X \setminus C$ such that $S(x,y) \neq 0$. Then any nontrivial linear combination of vectors in V has a non-zero entry in row x. Thus, these vectors are linearly independent, so C is independent.

Lemma 12. Let M be a matroid and let $S \in F^{X \times Y}$ be a standard representation matrix of M over a field F. Then $\forall y \in Y$, column $S^{\#}(\bullet, y)$ is the characteristic vector of $C(y, X) \setminus \{y\}$.

Proof. This directly follows from Lemma 11.

Lemma 13. Let A be a TU matrix.

- 1. If a matroid is represented by A, then it is also represented by $A^{\#}$.
- 2. If a matroid is represented by $A^{\#}$, then it is also represented by A.

Proof. See Lean implementation.

add details

1.4 Regular Matroids

Definition 14. A matroid M is regular if there exists $A \in \mathbb{Q}^{X \times Y}$ such that M = M[A] and A is TU.

Definition 15. We say that $A' \in \mathbb{Q}^{X \times Y}$ is a TU signing of $A \in \mathbb{Z}_2^{X \times Y}$ if A' is TU and

$$\forall i \in X, \ \forall j \in Y, \ |A'(i,j)| = A(i,j).$$

Lemma 16. Let M be a matroid given by a standard representation matrix $B \in \mathbb{Z}_2^{X \times Y}$. Then M is regular if and only if B has a TU signing.

Proof. Suppose that M is regular. By Definition 14, there exists $A \in \mathbb{Q}^{X \times Y}$ such that M = M[A] and A is TU. Recall that X (the row set of B) is a base of M. By Lemma 8, A can be converted into a standard representation matrix $B' \in \mathbb{Q}^{X \times Y}$ of M such that B' is also TU. Since B' and B are both standard representations of M, by Lemma 12 the support matrices $(B')^{\#}$ and $B^{\#}$ are the same. Moreover, $B^{\#} = B$, since B has entries in \mathbb{Z}_2 . Thus, B' is TU and $(B')^{\#} = B$, so B' is a TU signing of B. Suppose that B has a TU signing $B' \in \mathbb{Q}^{X \times Y}$. Then $A = [I \mid B']$ is TU, as it is obtained from B' by

Suppose that B has a TU signing $B' \in \mathbb{Q}^{X \times Y}$. Then $A = [I \mid B']$ is TU, as it is obtained from B' by adjoining the identity matrix. Moreover, by Lemma 13, A represents the same matroid as $A^{\#} = [I \mid B]$, which is M. Thus, A is a TU matrix representing M, so M is regular.

2 Regularity of 1-Sum

Write up based on Lean implementation

3 Regularity of 2-Sum

Definition 17. Let R be a semiring (we will use $R = \mathbb{Z}_2$ and $R = \mathbb{Q}$). Let $B_{\ell} \in R^{(X_{\ell} \cup \{x\}) \times Y_{\ell}}$ and $B_r \in R^{X_r \times (Y_r \cup \{y\})}$ be matrices of the form

$$B_{\ell} = \boxed{A_{\ell} \\ r}, \quad B_{r} = \boxed{c \mid A_{r}}$$

The 2-sum $B = B_{\ell} \oplus_{2,x,y} B_r$ of B_{ℓ} and B_r is defined as

$$B = \begin{array}{|c|c|c|} \hline A_{\ell} & 0 \\ \hline D & A_r \\ \hline \end{array} \quad \text{where} \quad D = c \otimes r.$$

Here $A_{\ell} \in R^{X_{\ell} \times Y_{\ell}}$, $A_r \in R^{X_r \times Y_r}$, $r \in R^{Y_{\ell}}$, $c \in R^{X_r}$, $D \in R^{X_r \times Y_{\ell}}$, and the indexing is consistent everywhere.

Definition 18. A matroid M is a 2-sum of matroids M_{ℓ} and M_r if there exist standard \mathbb{Z}_2 representation matrices B, B_{ℓ} , and B_r (for M, M_{ℓ} , and M_r , respectively) of the form given in Definition 17.

Lemma 19. Let B_{ℓ} and B_r from Definition 17 be TU matrices (over \mathbb{Q}). Then $C = \boxed{D \mid A_r}$ is TU.

Proof. Since B_{ℓ} is TU, all its entries are in $\{0, \pm 1\}$. In particular, r is a $\{0, \pm 1\}$ vector. Therefore, every column of D is a copy of y, -y, or the zero column. Thus, C can be obtained from B_r by adjoining zero columns, duplicating the y column, and multiplying some columns by -1. Since all these operations preserve TUess and since B_r is TU, C is also TU.

Lemma 20. Let B_{ℓ} and B_r be matrices from Definition 17. Let B'_{ℓ} and B' be the matrices obtained by performing a short tableau pivot on $(x_{\ell}, y_{\ell}) \in X_{\ell} \times Y_{\ell}$ in B_{ℓ} and B, respectively. Then $B' = B'_{\ell} \oplus_{2,x,y} B_r$.

Proof. Let

where the blocks have the same dimensions as in B_{ℓ} and B, respectively. By Lemma 4, $B'_{11} = A'_{\ell}$, $B'_{12} = 0$, and $B'_{22} = A_r$. Equality $B'_{21} = c \otimes r'$ can be verified via a direct calculation. Thus, $B' = B'_{\ell} \oplus_{2,x,y} B_r$.

Lemma 21. Let B_{ℓ} and B_r from Definition 17 be TU matrices (over \mathbb{Q}). Then $B_{\ell} \oplus_{2,x,y} B_r$ is TU.

Proof. By Lemma 3, it suffices to show that $B_{\ell} \oplus_{2,x,y} B_r$ is k-PU for every $k \in \mathbb{Z}_{\geq 1}$. We prove this claim by induction on k. The base case with k = 1 holds, since all entries of $B_{\ell} \oplus_{2,x,y} B_r$ are in $\{0, \pm 1\}$ by construction.

Suppose that for some $k \in \mathbb{Z}_{\geq 1}$ we know that for any TU matrices B'_{ℓ} and B'_{r} (from Definition 17) their 2-sum $B'_{\ell} \oplus_{2,x,y} B'_{r}$ is k-PU. Now, given TU matrices B_{ℓ} and B_{r} (from Definition 17), our goal is to show that $B = B_{\ell} \oplus_{2,x,y} B_{r}$ is (k+1)-PU, i.e., that every $(k+1) \times (k+1)$ submatrix T of B has det $T \in \{0, \pm 1\}$.

First, suppose that T has no rows in X_{ℓ} . Then T is a submatrix of $D \mid A_r$, which is TU by Lemma 19, so det $T \in \{0, \pm 1\}$. Thus, we may assume that T contains a row $x_{\ell} \in X_{\ell}$.

Next, note that without loss of generality we may assume that there exists $y_{\ell} \in Y_{\ell}$ such that $T(x_{\ell}, y_{\ell}) \neq 0$. Indeed, if $T(x_{\ell}, y) = 0$ for all y, then det T = 0 and we are done, and $T(x_{\ell}, y) = 0$ holds whenever $y \in Y_r$.

Since B is 1-PU, all entries of T are in $\{0,\pm 1\}$, and hence $T(x_\ell,y_\ell) \in \{\pm 1\}$. Thus, by Lemma 6, performing a short tableau pivot in T on (x_ℓ,y_ℓ) yields a matrix that contains a $k \times k$ submatrix T'' such that $|\det T| = |\det T''|$. Since T is a submatrix of B, matrix T'' is a submatrix of the matrix B' resulting from performing a short tableau pivot in B on the same entry (x_ℓ,y_ℓ) . By Lemma 20, we have $B' = B'_\ell \oplus_{2,x,y} B_r$ where B'_ℓ is the result of performing a short tableau pivot in B_ℓ on (x_ℓ,y_ℓ) . Since TUness is preserved by pivoting and B_ℓ is TU, B'_ℓ is also TU. Thus, by the inductive hypothesis applied to T'' and $B'_\ell \oplus_{2,x,y} B_r$, we have $\det T'' \in \{0,\pm 1\}$. Since $|\det T| = |\det T''|$, we conclude that $\det T \in \{0,\pm 1\}$.

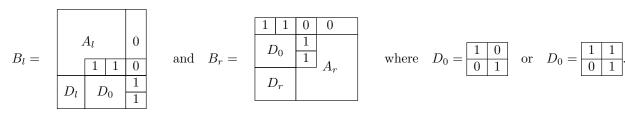

Lemma 22. Let M be a 2-sum of regular matroids M_{ℓ} and M_r . Then M is also regular.

Proof. Let B, B_{ℓ} , and B_r be standard \mathbb{Z}_2 representation matrices from Definition 18. Since M_{ℓ} and M_r are regular, by Lemma 16, B_{ℓ} and B_r have TU signings B'_{ℓ} and B'_{r} , respectively. Then $B' = B'_{\ell} \oplus_{2,x,y} B'_{r}$ is a TU signing of B. Indeed, B' is TU by Lemma 21, and a direct calculation verifies that B' is a signing of B. Thus, M is regular by Lemma 16.

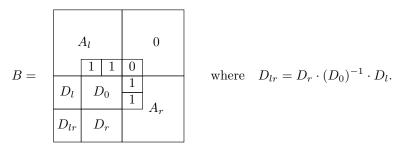

4 Regularity of 3-Sum

4.1 Definition

Definition 23. Let $B_l \in \mathbb{Z}_2^{(X_l \cup \{x_0, x_1\}) \times (Y_l \cup \{y_2\})}, B_r \in \mathbb{Z}_2^{(X_r \cup \{x_2\}) \times (Y_r \cup \{y_0, y_1\})}$ be matrices of the form

The 3-sum $B=B_l\oplus_3 B_r\in\mathbb{Z}_2^{(X_l\cup X_r)\times (Y_l\cup Y_r)}$ of B_l and B_r is defined as

Here $x_2 \in X_l$, $x_0, x_1 \in X_r$, $y_0, y_1 \in Y_l$, $y_2 \in Y_r$, $A_l \in \mathbb{Z}_2^{X_l \times Y_l}$, $A_r \in \mathbb{Z}_2^{X_r \times Y_r}$, $D_l \in \mathbb{Z}_2^{\{x_0, x_1\} \times \{Y_l \setminus \{y_0, y_1\}\}}$, $D_r \in \mathbb{Z}_2^{\{X_r \setminus \{x_0, x_1\}\} \times \{y_0, y_1\}\}}$, $D_0 \in \mathbb{Z}_2^{\{x_0, x_1\} \times \{y_0, y_1\}}$. The indexing is consistent everywhere.

Remark 24. In Definition 23, D_0 is non-singular by construction, so D_{lr} and B are well-defined. Moreover, a non-singular $\mathbb{Z}_2^{2\times 2}$ matrix is either $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ or $\begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ up to re-indexing. Thus, Definition 23 can be equivalently restated with D_0 required to be non-singular and B_l , B_r , and B_l re-indexed appropriately.

Definition 25. A matroid M is a 3-sum of matroids M_{ℓ} and M_r if there exist standard \mathbb{Z}_2 representation matrices B, B_{ℓ} , and B_r (for M, M_{ℓ} , and M_r , respectively) of the form given in Definition 23.

4.2 Canonical Signing

Definition 26. We call $D_0' \in \mathbb{Q}^{\{x_0,x_1\} \times \{y_0,y_1\}}$ the canonical signing of $D_0 \in \mathbb{Z}_2^{\{x_0,x_1\} \times \{y_0,y_1\}}$ if

$$D_0 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$
 and $D'_0 = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$, or $D_0 = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ and $D'_0 = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$.

Similarly, we call $S' \in \mathbb{Q}^{\{x_0,x_1,x_2\} \times \{y_0,y_1,y_2\}}$ the canonical signing of $S \in \mathbb{Z}_2^{\{x_0,x_1,x_2\} \times \{y_0,y_1,y_2\}}$ if

To simplify notation, going forward we use D_0 , D'_0 , S, and S' to refer to the matrices of the form above.

Lemma 27. The canonical signing S' of S (from Definition 26) is TU.

Proof. Verified via a direct calculation.

Lemma 28. Let Q be a TU signing of S (from Definition 26). Let $u \in \{0, \pm 1\}^{\{x_0, x_1, x_2\}}, v \in \{0, \pm 1\}^{\{y_0, y_1, y_2\}},$ and Q' be defined as follows:

$$u(i) = \begin{cases} Q(x_2, y_0) \cdot Q(x_0, y_0), & i = x_0, \\ Q(x_2, y_0) \cdot Q(x_0, y_0) \cdot Q(x_0, y_2) \cdot Q(x_1, y_2), & i = x_1, \\ 1, & i = x_2, \end{cases}$$

$$v(j) = \begin{cases} Q(x_2, y_0), & j = y_0, \\ Q(x_2, y_1), & j = y_1, \\ Q(x_2, y_0) \cdot Q(x_0, y_0) \cdot Q(x_0, y_2), & j = y_2, \end{cases}$$

$$'(i, j) = Q(i, j) \cdot u(i) \cdot v(j) \quad \forall i \in \{x_0, x_1, x_2\}, \ \forall j \in \{y_0, y_1, y_2\}.$$

Then Q' = S' (from Definition 26).

Proof. Since Q is a TU signing of S and Q' is obtained from Q by multiplying rows and columns by ± 1 factors, Q' is also a TU signing of S. By construction, we have

$$\begin{split} &Q'(x_2,y_0) = Q(x_2,y_0) \cdot 1 \cdot Q(x_2,y_0) = 1, \\ &Q'(x_2,y_1) = Q(x_2,y_1) \cdot 1 \cdot Q(x_2,y_1) = 1, \\ &Q'(x_2,y_2) = 0, \\ &Q'(x_0,y_0) = Q(x_0,y_0) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_0)) \cdot Q(x_2,y_0) = 1, \\ &Q'(x_0,y_1) = Q(x_0,y_1) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_0)) \cdot Q(x_2,y_1), \\ &Q'(x_0,y_2) = Q(x_0,y_2) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_0)) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_0) \cdot Q(x_0,y_0)) = 1, \\ &Q'(x_1,y_0) = 0, \\ &Q'(x_1,y_1) = Q(x_1,y_1) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_0) \cdot Q(x_0,y_2) \cdot Q(x_1,y_2)) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_0) \cdot Q(x_0,y_2)) = 1. \end{split}$$

Thus, it remains to show that $Q'(x_0, y_1) = S'(x_0, y_1)$ and $Q'(x_1, y_1) = S'(x_1, y_1)$.

Consider the entry $Q'(x_0, y_1)$. If $D_0(x_0, y_1) = 0$, then $Q'(x_0, y_1) = 0 = S'(x_0, y_1)$. Otherwise, we have $D_0(x_0, y_1) = 1$, and so $Q'(x_0, y_1) \in \{\pm 1\}$, as Q' is a signing of S. If $Q'(x_0, y_1) = -1$, then

$$\det Q'(\{x_0, x_2\}, \{y_0, y_1\}) = \det \boxed{\begin{array}{c|c} 1 & -1 \\ \hline 1 & 1 \end{array}} = 2 \notin \{0, \pm 1\},$$

which contradicts TUness of Q'. Thus, $Q'(x_0, y_1) = 1 = S'(x_0, y_1)$.

Consider the entry $Q'(x_1, y_1)$. Since Q' is a signing of S, we have $Q'(x_1, y_1) \in \{\pm 1\}$. Consider two cases.

2. Suppose that
$$D_0 = \boxed{\frac{1}{0} \ \frac{1}{1}}$$
. If $Q'(x_1, y_1) = -1$, then $\det Q(\{x_0, x_1\}, \{y_1, y_2\}) = \det \boxed{\frac{1}{-1} \ \frac{1}{1}} = 2 \notin \{0, \pm 1\}$, which contradicts TUness of Q' . Thus, $Q'(x_1, y_1) = 1 = S'(x_1, y_1)$.

Definition 29. Let X and Y be sets with $\{x_0, x_1, x_2\} \subseteq X$ and $\{y_0, y_1, y_2\} \subseteq Y$. Let $Q \in \mathbb{Q}^{X \times Y}$ be a TU

matrix. Define $u \in \{0, \pm 1\}^X, v \in \{0, \pm 1\}^Y$, and Q' as follows:

$$u(i) = \begin{cases} Q(x_2, y_0) \cdot Q(x_0, y_0), & i = x_0, \\ Q(x_2, y_0) \cdot Q(x_0, y_0) \cdot Q(x_0, y_2) \cdot Q(x_1, y_2), & i = x_1, \\ 1, & i = x_2, \\ 1, & i \in X \setminus \{x_0, x_1, x_2\}, \end{cases}$$

$$v(j) = \begin{cases} Q(x_2, y_0), & j = y_0, \\ Q(x_2, y_1), & j = y_1, \\ Q(x_2, y_0) \cdot Q(x_0, y_0) \cdot Q(x_0, y_2), & j = y_2, \\ 1, & j \in Y \setminus \{y_0, y_1, y_2\}, \end{cases}$$

$$Q'(i, j) = Q(i, j) \cdot u(i) \cdot v(j) \quad \forall i \in X, \ \forall j \in Y.$$

We call Q' the canonical re-signing of Q.

Lemma 30. Let X and Y be sets with $\{x_0, x_1, x_2\} \subseteq X$ and $\{y_0, y_1, y_2\} \subseteq Y$. Let $Q \in \mathbb{Q}^{X \times Y}$ be a TU signing of $Q_0 \in \mathbb{Z}_2^{X \times Y}$ such that $Q_0(\{x_0, x_1, x_2\}, \{y_0, y_1, y_2\}) = S$ (from Definition 26). Then the canonical re-signing Q' of Q is a TU signing of Q_0 and $Q'(\{x_0, x_1, x_2\}, \{y_0, y_1, y_2\}) = S'$ (from Definition 26).

Proof. Since Q is a TU signing of Q_0 and Q' is obtained from Q by multiplying some rows and columns by ± 1 factors, Q' is also a TU signing of Q_0 . Equality $Q'(\{x_0, x_1, x_2\}, \{y_0, y_1, y_2\}) = S'$ follows from Lemma 28. \square

Definition 31. Suppose that B_l and B_r from Definition 23 have TU signings B'_l and B'_r , respectively. Let B''_l and B''_r be the canonical re-signings (from Definition 29) of B'_l and B'_r , respectively. Let A''_l , A''_r , D''_l , and D''_0 be blocks of B''_l and B''_r analogous to blocks A_l , A_r , D_l , D_r , and D_0 of B_l and B_r . The canonical signing B'' of B is defined as

Remark 32. In Definition 31, D_0'' is non-singular by construction, so D_{lr}'' and hence B'' are well-defined.

4.3 Properties of Canonical Signing

Lemma 33. B'' from Definition 31 is a signing of B.

Proof. By Lemma 30, B''_l and B''_r are TU signings of B_l and B_r , respectively. As a result, blocks A''_l , A''_r , D''_l , D''_r , and D''_0 in B'' are signings of the corresponding blocks in B. Thus, it remains to show that D''_{lr} is a signing of D_{lr} . This can be verified via a direct calculation.

need details?

Lemma 34. Suppose that B_r from Definition 23 has a TU signing B'_r . Let B''_r be the canonical re-signing (from Definition 29) of B'_r . Let $c''_0 = B''_r(X_r, y_0)$, $c''_1 = B''_r(X_r, y_1)$, and $c''_2 = c''_0 - c''_1$. Then the following statements hold.

- 1. For every $i \in X_r$, $c_0''(i) | c_1''(i) | \in \{0, \pm 1\}^{\{y_0, y_1\}} \setminus \{\boxed{1} \ \boxed{-1}, \boxed{-1} \ \boxed{1} \}$.
- 2. For every $i \in X_r$, $c_2''(i) \in \{0, \pm 1\}$.
- 3. $\boxed{c_0'' \mid c_2'' \mid A_r''}$ is TU.
- 4. $\begin{bmatrix} c_1'' & c_2'' & A_r'' \end{bmatrix}$ is TU.

5. $c_0'' | c_1'' | c_2'' | A_r''$ is TU.

Proof. Throughout the proof we use that B''_r is TU, which holds by Lemma 30.

1. Since B_r'' is TU, all its entries are in $\{0,\pm 1\}$, and in particular $\boxed{c_0''(i) \mid c_1''(i)} \in \{0,\pm 1\}^{\{y_0,y_1\}}$. If $\boxed{c_0'(i) \mid c_1''(i)} = \boxed{1 \mid -1}$, then

$$\det B_r''(\{x_2, i\}, \{y_0, y_1\}) = \det \boxed{\begin{array}{c|c} 1 & 1 \\ \hline 1 & -1 \end{array}} = -2 \notin \{0, \pm 1\},$$

which contradicts TUness of B_r'' . Similarly, if $c_0''(i) | c_1''(i) | = \boxed{-1 | 1}$, then

$$\det B_r''(\{x_2,i\},\{y_0,y_1\}) = \det \frac{1}{-1} \frac{1}{1} = 2 \notin \{0,\pm 1\},$$

which contradicts TUness of B_r'' . Thus, the desired statement holds.

- 2. Follows from item 1 and a direct calculation.
- 3. Performing a short tableau pivot in B''_r on (x_2, y_0) yields:

The resulting matrix can be transformed into $\boxed{c_0'' \ c_2'' \ A_r''}$ by removing row x_2 and multiplying columns y_0 and y_1 by -1. Since B_r'' is TU and since TUness is preserved under pivoting, taking submatrices, multiplying columns by ± 1 factors, we conclude that $\boxed{c_0'' \ c_2'' \ A_r''}$ is TU.

4. Similar to item 4, performing a short tableau pivot in B''_r on (x_2, y_1) yields:

	1	1	0		1	1	0
$B_r^{\prime\prime}=$	c_0''	c_1''	A_r''	\rightarrow	$c_0^{\prime\prime}-c_1^{\prime\prime}$	$-c_1^{\prime\prime}$	A_r''

The resulting matrix can be transformed into $\boxed{c_1'' \ | \ c_2'' \ | \ A_r''}$ by removing row x_2 , multiplying column y_1 by -1, and swapping the order of columns y_0 and y_1 . Since B_r'' is TU and since TUness is preserved under pivoting, taking submatrices, multiplying columns by ± 1 factors, and re-ordering columns, we conclude that $\boxed{c_1'' \ | \ c_2'' \ | \ A_r''}$ is TU.

5. Let V be a square submatrix of $\boxed{c_0'' \mid c_1'' \mid c_2'' \mid A_r''}$. Our goal is to show that $\det V \in \{0, \pm 1\}$.

Suppose that column c_2'' is not in V. Then V is a submatrix of B_r'' , which is TU. Thus, $\det V \in \{0, \pm 1\}$. Going forward we assume that column z is in V.

Suppose that columns c_0'' and c_1'' are both in V. Then V contains columns c_0'' , c_1'' , and $c_2'' = c_0'' - c_1''$, which are linearly. Thus, $\det V = 0$. Going forward we assume that at least one of the columns c_0'' and c_1'' is not in V.

Suppose that column c_1'' is not in V. Then V is a submatrix of $\boxed{c_0'' \mid c_2'' \mid A_r''}$, which is TU by item 3. Thus, $\det V \in \{0, \pm 1\}$. Similarly, if column c_0'' is not in V, then V is a submatrix of $\boxed{c_1'' \mid c_2'' \mid A_r''}$, which is TU by item 4. Thus, $\det V \in \{0, \pm 1\}$.

Lemma 35. Suppose that B_l from Definition 23 has a TU signing B'_l . Let B''_l be the canonical re-signing (from Definition 29) of B'_l . Let $d''_0 = B''_l(x_0, Y_l)$, $d''_1 = B''_l(x_1, Y_l)$, and $d''_2 = d''_0 - d''_1$. Then the following statements hold.

1. For every
$$j \in Y_l$$
, $d_0''(j) \in \{0, \pm 1\}^{\{x_0, x_1\}} \setminus \{ \begin{bmatrix} 1 \\ -1 \end{bmatrix}, \begin{bmatrix} -1 \\ 1 \end{bmatrix} \}$.

2. For every $j \in Y_l, d_2''(j) \in \{0, \pm 1\}.$

3.
$$\begin{array}{|c|c|} \hline A_l^{\prime\prime} \\ \hline d_0^{\prime\prime} \\ \hline d_2^{\prime\prime} \\ \end{array}$$
 is TU.

4.
$$\frac{A_l''}{d_1''}$$
 is TU.

Proof. Apply Lemma 34 to B_l^{\top} , or repeat the same arguments up to transposition.

Lemma 36. Let B'' be from Definition 31. Let $c_0'' = B''(X_r, y_0)$, $c_1'' = B''(X_r, y_1)$, and $c_2'' = c_0'' - c_1''$. Similarly, let $d_0'' = B''(x_0, Y_l)$, $d_1'' = B''(x_1, Y_l)$, and $d_2'' = d_0'' - d_1''$. Then the following statements hold.

1. For every $i \in X_r$, $c_2''(i) \in \{0, \pm 1\}$.

3. For every $j \in Y_l$, $D''(X_r, j) \in \{0, \pm c_0'', \pm c_1'', \pm c_2''\}$.

4. For every $i \in X_r$, $D''(i, Y_l) \in \{0, \pm d_0'', \pm d_1'', \pm d_2''\}$.

5.
$$D'' \mid A''_r$$
 is TU.

6.
$$A_l''$$
 is TU.

Proof. 1. Holds by Lemma 34.2.

2. Note that

Thus,

$$D'' = \boxed{\begin{array}{c|c} D_l'' & D_0'' \\ D_{lr}'' & D_r'' \end{array}} = \boxed{\begin{array}{c|c} D_0'' \\ D_r'' \end{array}} \cdot (D_0'')^{-1} \cdot \boxed{\begin{array}{c|c} D_l'' & D_0'' \end{array}} = \boxed{\begin{array}{c|c} c_0'' & c_1'' \end{array}} \cdot (D_0'')^{-1} \cdot \boxed{\begin{array}{c|c} d_0'' \\ d_1'' \end{array}}.$$

Considering the two cases for D_0'' and performing the calculations yields the desired results.

3. Let
$$j \in Y_l$$
. By Lemma 35.1, $\boxed{\frac{d_0''(i)}{d_1''(j)}} \in \{0, \pm 1\}^{\{x_0, x_1\}} \setminus \{\boxed{\frac{1}{-1}}, \boxed{\frac{-1}{1}}\}$. Consider two cases.

(a) If
$$D_0'' = \boxed{\frac{1}{0} - 1}$$
, then by item 2 we have $D''(X_r, j) = d_0''(j) \cdot c_0'' + (-d_1''(j)) \cdot c_1''$. By considering all possible cases for $d_0''(j)$ and $d_1''(j)$, we conclude that $D''(X_r, j) \in \{0, \pm c_0'', \pm c_1'', \pm (c_0'' - c_1'')\}$.

- (b) If $D_0'' = \frac{ 1 \ | \ 1 \ |}{ 0 \ | \ 1 \ |}$, then by item 2 we have $D''(X_r, j) = (d_0''(j) d_1''(j)) \cdot c_0'' + d_1''(j) \cdot c_1''$. By considering all possible cases for $d_0''(j)$ and $d_1''(j)$, we conclude that $D''(X_r, j) \in \{0, \pm c_0'', \pm c_1'', \pm (c_0'' - c_1'')\}$.
- 4. Let $i \in X_r$. By Lemma 34.1, $c_0''(i) \mid c_1''(i) \mid \in \{0, \pm 1\}^{\{y_0, y_1\}} \setminus \{\boxed{1} \mid -1 \rceil, \boxed{-1} \mid 1 \}$. Consider two cases.
 - (a) If $D_0'' = \boxed{\frac{1 \quad 0}{0 \quad -1}}$, then by item 2 we have $D''(i, Y_l) = c_0''(i) \cdot d_0'' + (-c_1''(i)) \cdot d_1''$. By considering all possible cases for $c_0''(i)$ and $c_1''(i)$, we conclude that $D''(i, Y_l) \in \{0, \pm d_0'', \pm d_1'', \pm d_2''\}$.
 - (b) If $D_0'' = \boxed{\frac{1}{0} \ \frac{1}{1}}$, then by item 2 we have $D''(i, Y_l) = c_0''(i) \cdot d_0'' + (c_1''(i) c_0''(i)) \cdot d_1''$. By considering all possible cases for $c_0''(i)$ and $c_1''(i)$, we conclude that $D''(i,Y_i) \in \{0,\pm d_0'',\pm d_1'',\pm d_2''\}$.
- 5. By Lemma 34.5, $c_0'' \mid c_1'' \mid c_2'' \mid A_r''$ is TU. Since TUness is preserved under adjoining zero columns, copies of existing columns, and multiplying columns by ± 1 factors, $0 \pm c_0'' \pm c_1'' \pm c_2'' A_r''$ is also TU. By item 3, $D'' \mid A''_r$ is a submatrix of the latter matrix, hence it is also TU.
- 6. By Lemma 35.5, $\frac{\left|\frac{a_0''}{d_0''}\right|}{\left|\frac{d_1''}{d_1''}\right|}$ is TU. Since TUness is preserved under adjoining zero rows, copies of existing

rows, and multiplying rows by ± 1 factors, $\begin{bmatrix} A_l'' \\ 0 \\ \pm d_0'' \\ \vdots \\ + d'' \end{bmatrix}$ is also TU. By item 4, $\begin{bmatrix} A_l'' \\ D'' \end{bmatrix}$ is a submatrix of the

latter matrix, hence it is also TU.

Proof of Regularity

Definition 37. Let X_l, Y_l, X_r, Y_r be sets and let $c_0, c_1 \in \mathbb{Q}^{X_r}$ be column vectors such that for every $i \in X_r$ we have $c_0(i), c_1(i), c_0(i) - c_1(i) \in \{0, \pm 1\}$. Define $\mathcal{C}(X_l, Y_l, X_r, Y_r; c_0, c_1)$ to be the family of matrices of the form $A_l \mid 0$ where $A_l \in \mathbb{Q}^{X_l \times Y_l}, A_r \in \mathbb{Q}^{X_r \times Y_r}$, and $D \in \mathbb{Q}^{X_r \times Y_l}$ are such that: (a) for every $j \in Y_r$, $D(X_r, j) \in \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}$, (b) $c_0 \mid c_1 \mid c_0 - c_1 \mid A_r$ is TU, (c) $A_l \mid D$ is TU.

$$D(X_r, j) \in \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}, \text{ (b) } \boxed{c_0 \mid c_1 \mid c_0 - c_1 \mid A_r} \text{ is TU, (c) } \boxed{A_l \mid D} \text{ is TU.}$$

Lemma 38. Let B'' be from Definition 31. Then $B'' \in \mathcal{C}(X_l, Y_l, X_r, Y_r; c_0'', c_1'')$ where $c_0'' = B''(X_r, y_0)$ and $c_1'' = B''(X_r, y_1).$

Proof. Recall that $c_0'' - c_1'' \in \{0, \pm 1\}^{X_r}$ by Lemma 36.1, so $\mathcal{C}(X_l, Y_l, X_r, Y_r; c_0'', c_1'')$ is well-defined. To see that $B'' \in \mathcal{C}(X_l, Y_l, X_r, Y_r; c_0'', c_1'')$, note that all properties from Definition 37 are satisfied: property (a) holds by Lemma 36.3, property (b) holds by Lemma 34.5, and property (c) holds by Lemma 36.6.

Lemma 39. Let $C \in \mathcal{C}(X_l, Y_l, X_r, Y_r; c_0, c_1)$ from Definition 37. Let $x \in X_l$ and $y \in Y_l$ be such that $A_l(x,y) \neq 0$, and let C' be the result of performing a short tableau pivot in C on (x,y). Then $C' \in$ $C(X_l, Y_l, X_r, Y_r; c_0, c_1).$

Proof. Our goal is to show that C' satisfies all properties from Definition 37. Let $C' = \frac{\mid C'_{11} \mid C'_{12} \mid}{\mid C'_{21} \mid \mid C'_{22} \mid}$, and let

 $\begin{bmatrix} A'_l \\ D' \end{bmatrix}$ be the result of performing a short tableau pivot on (x,y) in $\begin{bmatrix} A_l \\ D \end{bmatrix}$. Observe the following.

• By Lemma 4, $C'_{11} = A'_l$, $C'_{12} = 0$, $C'_{21} = D'$, and $C'_{22} = A_r$.

- Since $\boxed{\frac{A_l}{D}}$ is TU by property (c) for C, all entries of A_l are in $\{0, \pm 1\}$.
- $A_l(x,y) \in \{\pm 1\}$, as $A_l(x,y) \in \{0,\pm 1\}$ by the above observation and $A_l(x,y) \neq 0$ by the assumption.
- Since $A_l \over D$ is TU by property (c) for C and since pivoting preserves TUness, $A'_l \over D'$ is also TU.

These observations immediately imply properties (b) and (c) for C'. Indeed, property (b) holds for C', These observations immediately imply properties (b) and (c) for C'. Indeed, property (d) notes for C, since $C'_{22} = A_r$ and $\boxed{c_0} \boxed{c_1} \boxed{c_0 - c_1} \boxed{A_r}$ is TU by property (b) for C. On the other hand, property (c) follows from $C'_{11} = A'_l$, $C'_{21} = D'$, and $\boxed{A'_l} \boxed{D'}$ being TU. Thus, it only remains to show that C' satisfies property (a). Let $j \in Y_r$. Our goal is to prove that $D'(X_r, j) \in \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}$. Suppose j = y. By the pivot formula, $D'(X_r, y) = -\frac{D(X_r, y)}{A_l(x, y)}$. Since $D(X_r, y) \in \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}$ by property (a) for C and since $A_l(x, y) \in \{\pm 1\}$, we get $D'(X_r, y) \in \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}$. Now suppose $j \in Y_l \setminus \{y\}$. By the pivot formula, $D'(X_r, j) = D(X_r, j) - \frac{A_l(x, j)}{A_l(x, y)} \cdot D(X_r, y)$. Here $D(Y_r, j) = D(X_r, j) = \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}$ by property (a) for C, and $A_l(x, j) \in \{0, \pm 1\}$ and $A_l(x, y) \in \{0, \pm 1\}$ a

 $D(X_r, j), D(X_r, y) \in \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}$ by property (a) for C, and $A_l(x, j) \in \{0, \pm 1\}$ and $A_l(x, y) \in \{0, \pm 1\}$ $\{\pm 1\}$ by the prior observations. Perform an exhaustive case distinction on $D(X_r,j), D(X_r,y), A_l(x,j),$ and $A_l(x,y)$. In every case, we can show that either $A_l(x,y)$ $A_l(x,j)$ contains a submatrix with determinant not in $\{0,\pm 1\}$, which contradicts TUness of A_l , or that $D'(X_r,j) \in \{0,\pm c_0,\pm c_1,\pm (c_0-c_1)\}$, as desired. \Box need details?

Lemma 40. Let $C \in \mathcal{C}(X_l, Y_l, X_r, Y_r; c_0, c_1)$ from Definition 37. Then C is TU.

Proof. By Lemma 3, it suffices to show that C is k-PU for every $k \in \mathbb{Z}_{\geq 1}$. We prove this claim by induction on k. The base case with k=1 holds, since properties (b) and (c) in Definition 37 imply that A_l , A_r , and D are TU, so all their entries of $C = \begin{bmatrix} A_l & 0 \\ \hline D & A_r \end{bmatrix}$ are in $\{0, \pm 1\}$, as desired. Suppose that for some $k \in \mathbb{Z}_{\geq 1}$ we know that every $C' \in \mathcal{C}(X_l, Y_l, X_r, Y_r; c_0, c_1)$ is k-PU. Our goal is to

show that C is k-PU, i.e., that every $(k+1) \times (k+1)$ submatrix S of C has det $V \in \{0, \pm 1\}$.

First, suppose that V has no rows in X_{ℓ} . Then V is a submatrix of $D \mid A_r$, which is TU by property (b) in Definition 37, so det $V \in \{0, \pm 1\}$. Thus, we may assume that S contains a row $x_{\ell} \in X_{\ell}$.

Next, note that without loss of generality we may assume that there exists $y_{\ell} \in Y_{\ell}$ such that $V(x_{\ell}, y_{\ell}) \neq 0$. Indeed, if $V(x_{\ell}, y) = 0$ for all y, then det V = 0 and we are done, and $V(x_{\ell}, y) = 0$ holds whenever $y \in Y_r$.

Since C is 1-PU, all entries of V are in $\{0,\pm 1\}$, and hence $V(x_{\ell},y_{\ell}) \in \{\pm 1\}$. Thus, by Lemma 6, performing a short tableau pivot in V on (x_{ℓ}, y_{ℓ}) yields a matrix that contains a $k \times k$ submatrix S'' such that $|\det V| = |\det V''|$. Since V is a submatrix of C, matrix V'' is a submatrix of the matrix C' resulting from performing a short tableau pivot in C on the same entry (x_{ℓ}, y_{ℓ}) . By Lemma 39, we have $C' \in$ $\mathcal{C}(X_l, Y_l, X_r, Y_r; c_0, c_1)$. Thus, by the inductive hypothesis applied to V'' and C', we have $\det V'' \in \{0, \pm 1\}$. Since $|\det V| = |\det V''|$, we conclude that $\det V \in \{0, \pm 1\}$.

Lemma 41. B'' from Definition 31 is TU.

Proof. Combine the results of Lemmas 38 and 40.

Lemma 42. Let M be a 3-sum of regular matroids M_{ℓ} and M_r . Then M is also regular.

Proof. Let B, B_{ℓ} , and B_r be standard \mathbb{Z}_2 representation matrices from Definition 25. Since M_{ℓ} and M_r are regular, by Lemma 16, B_{ℓ} and B_r have TU signings. Then the canonical signing B'' from Definition 31 is a TU signing of B. Indeed, B'' is a signing of B by Lemma 33, and B'' is TU by Lemma 41. Thus, M is regular by Lemma 16.
